DeepSee

DeepSee

Interpolating sparse data to guide
deep sea core sample site selection

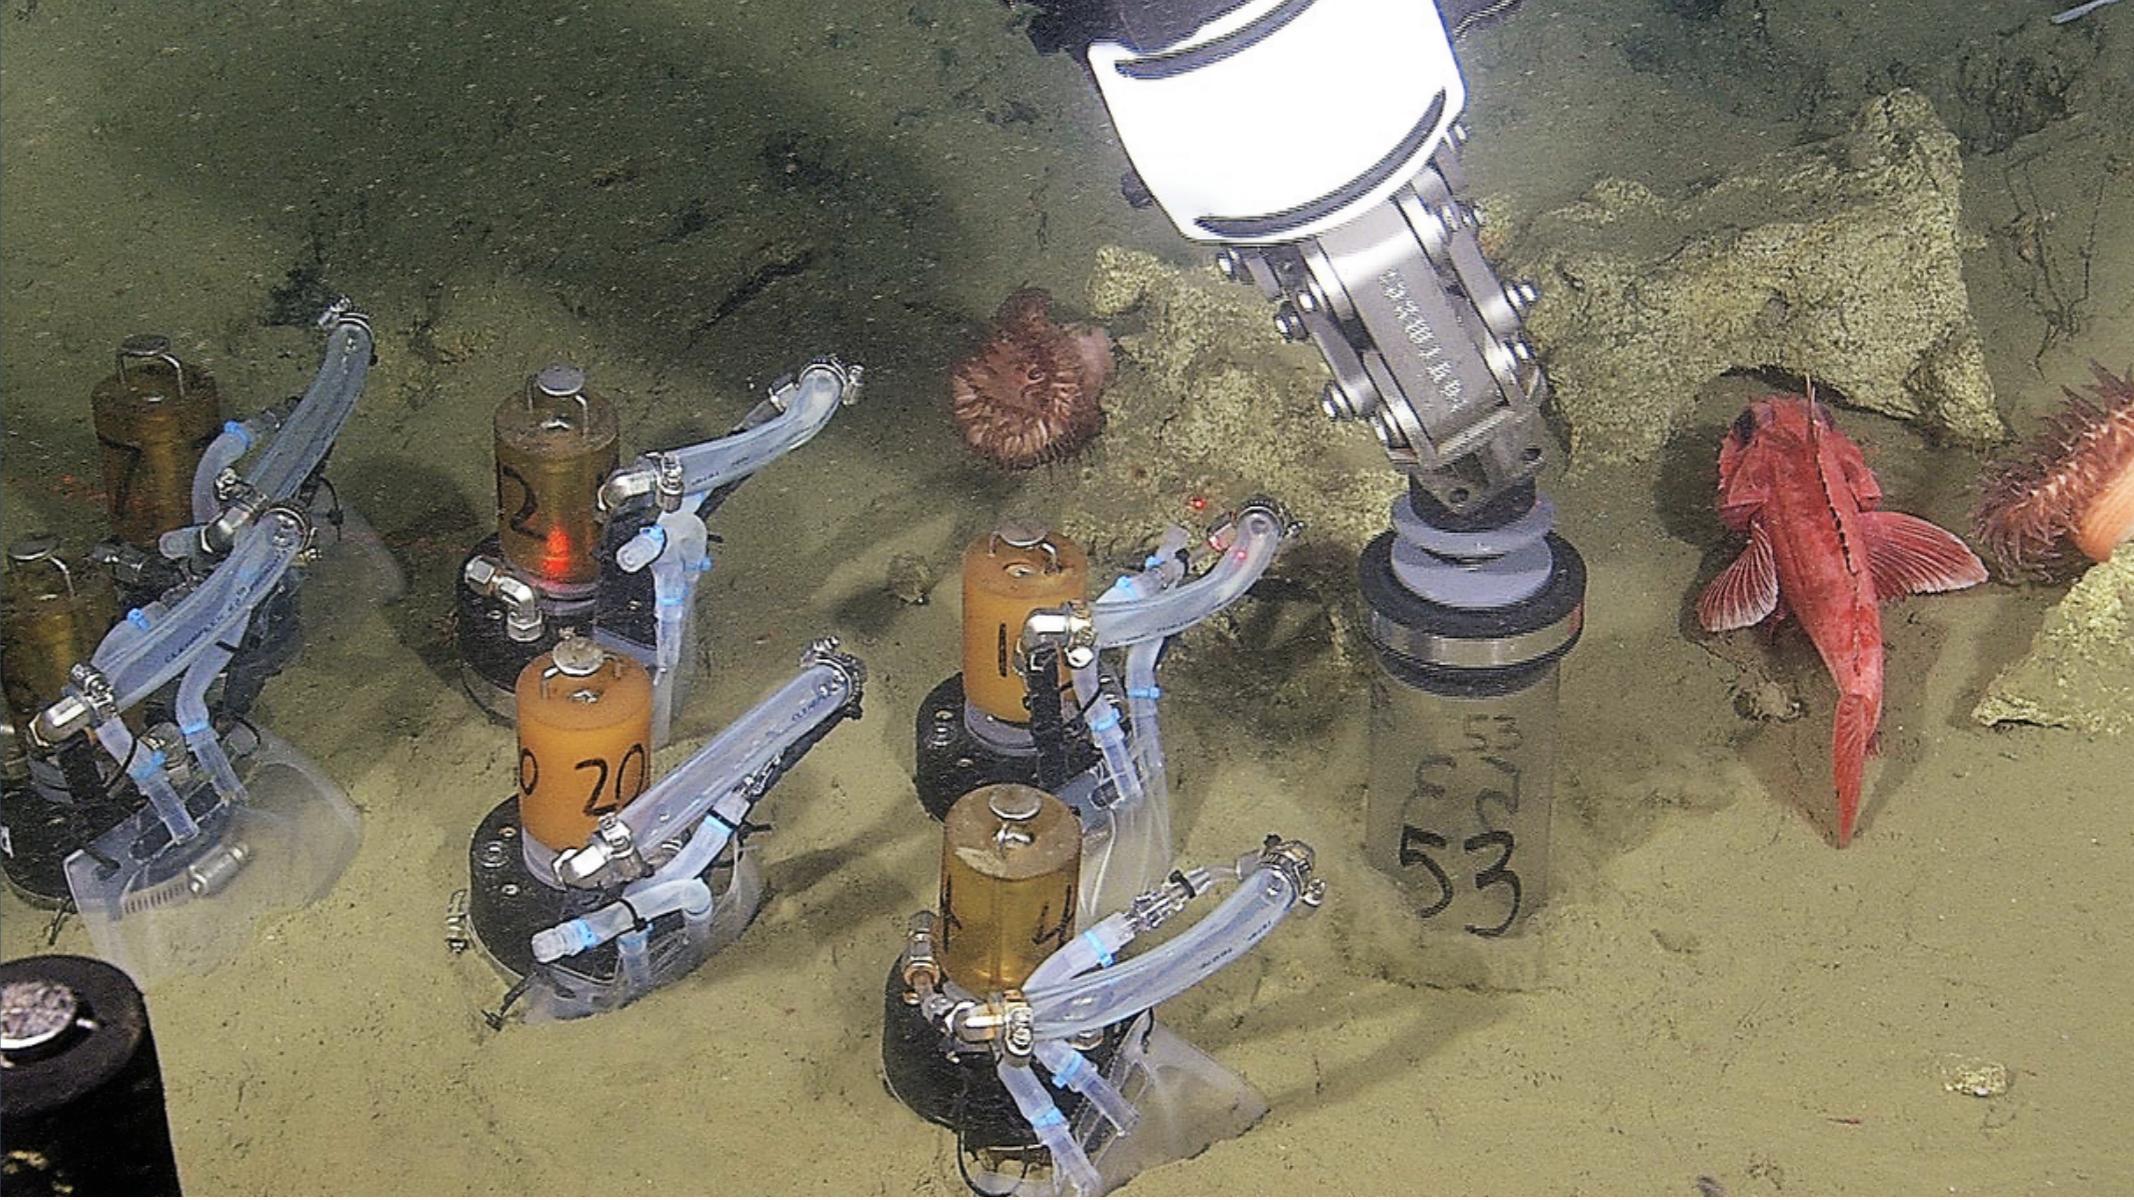

Scientists at Caltech's Orphan Lab are actively studying microbial communities that live around methane seeps at the bottom of the ocean.

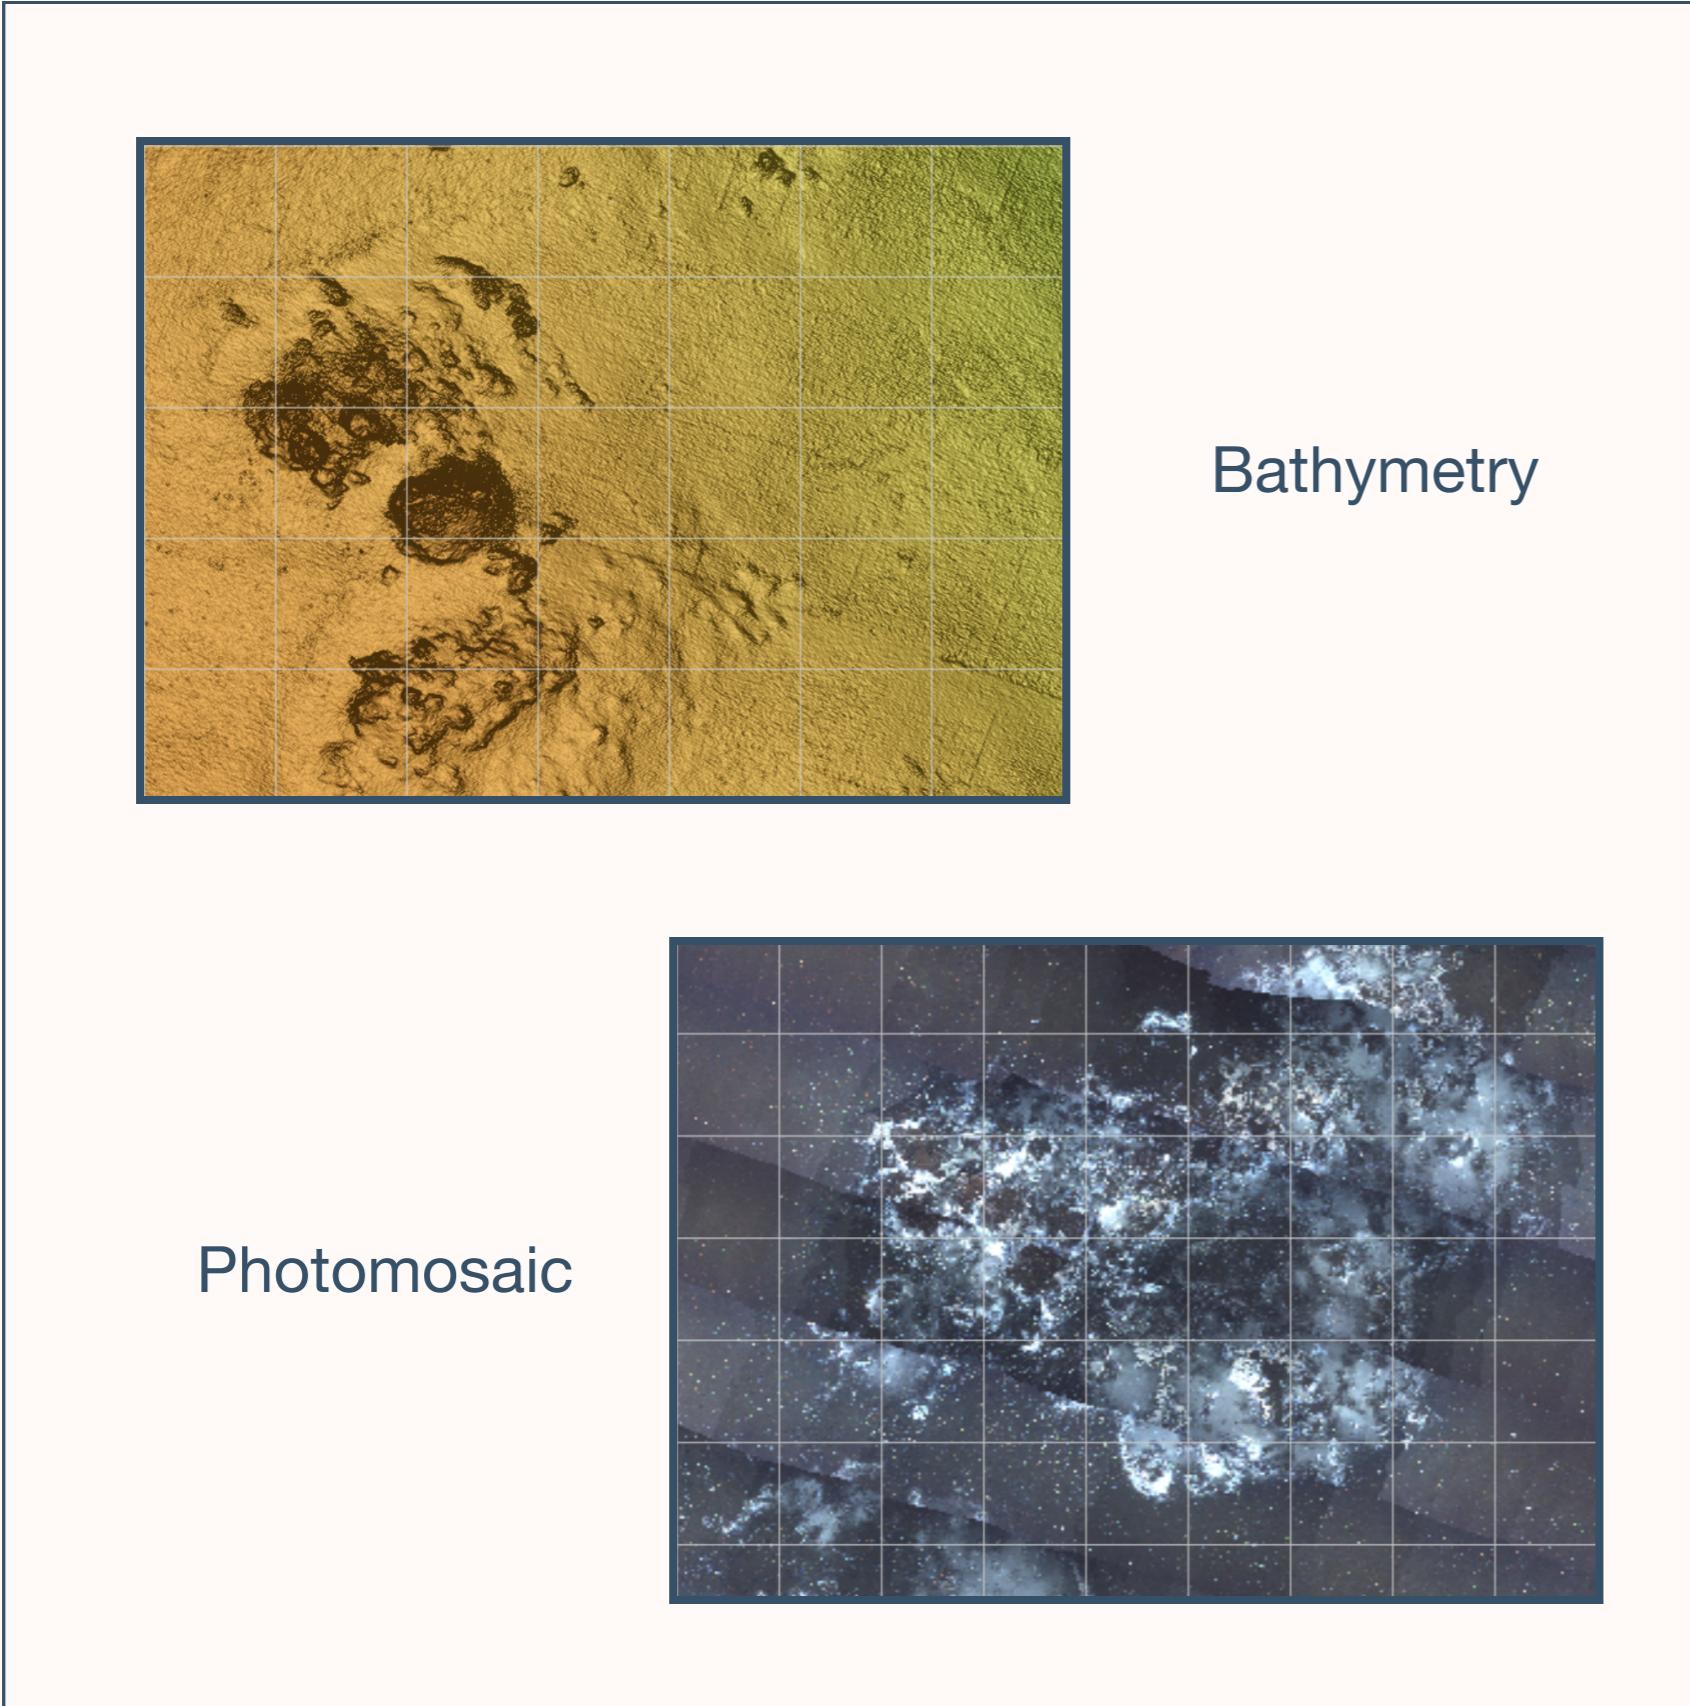

These microbes consume huge amounts of methane, preventing it from reaching the atmosphere and contributing to climate change.

To study these microbes, scientists survey the ocean floor and draw core samples using underwater robots.

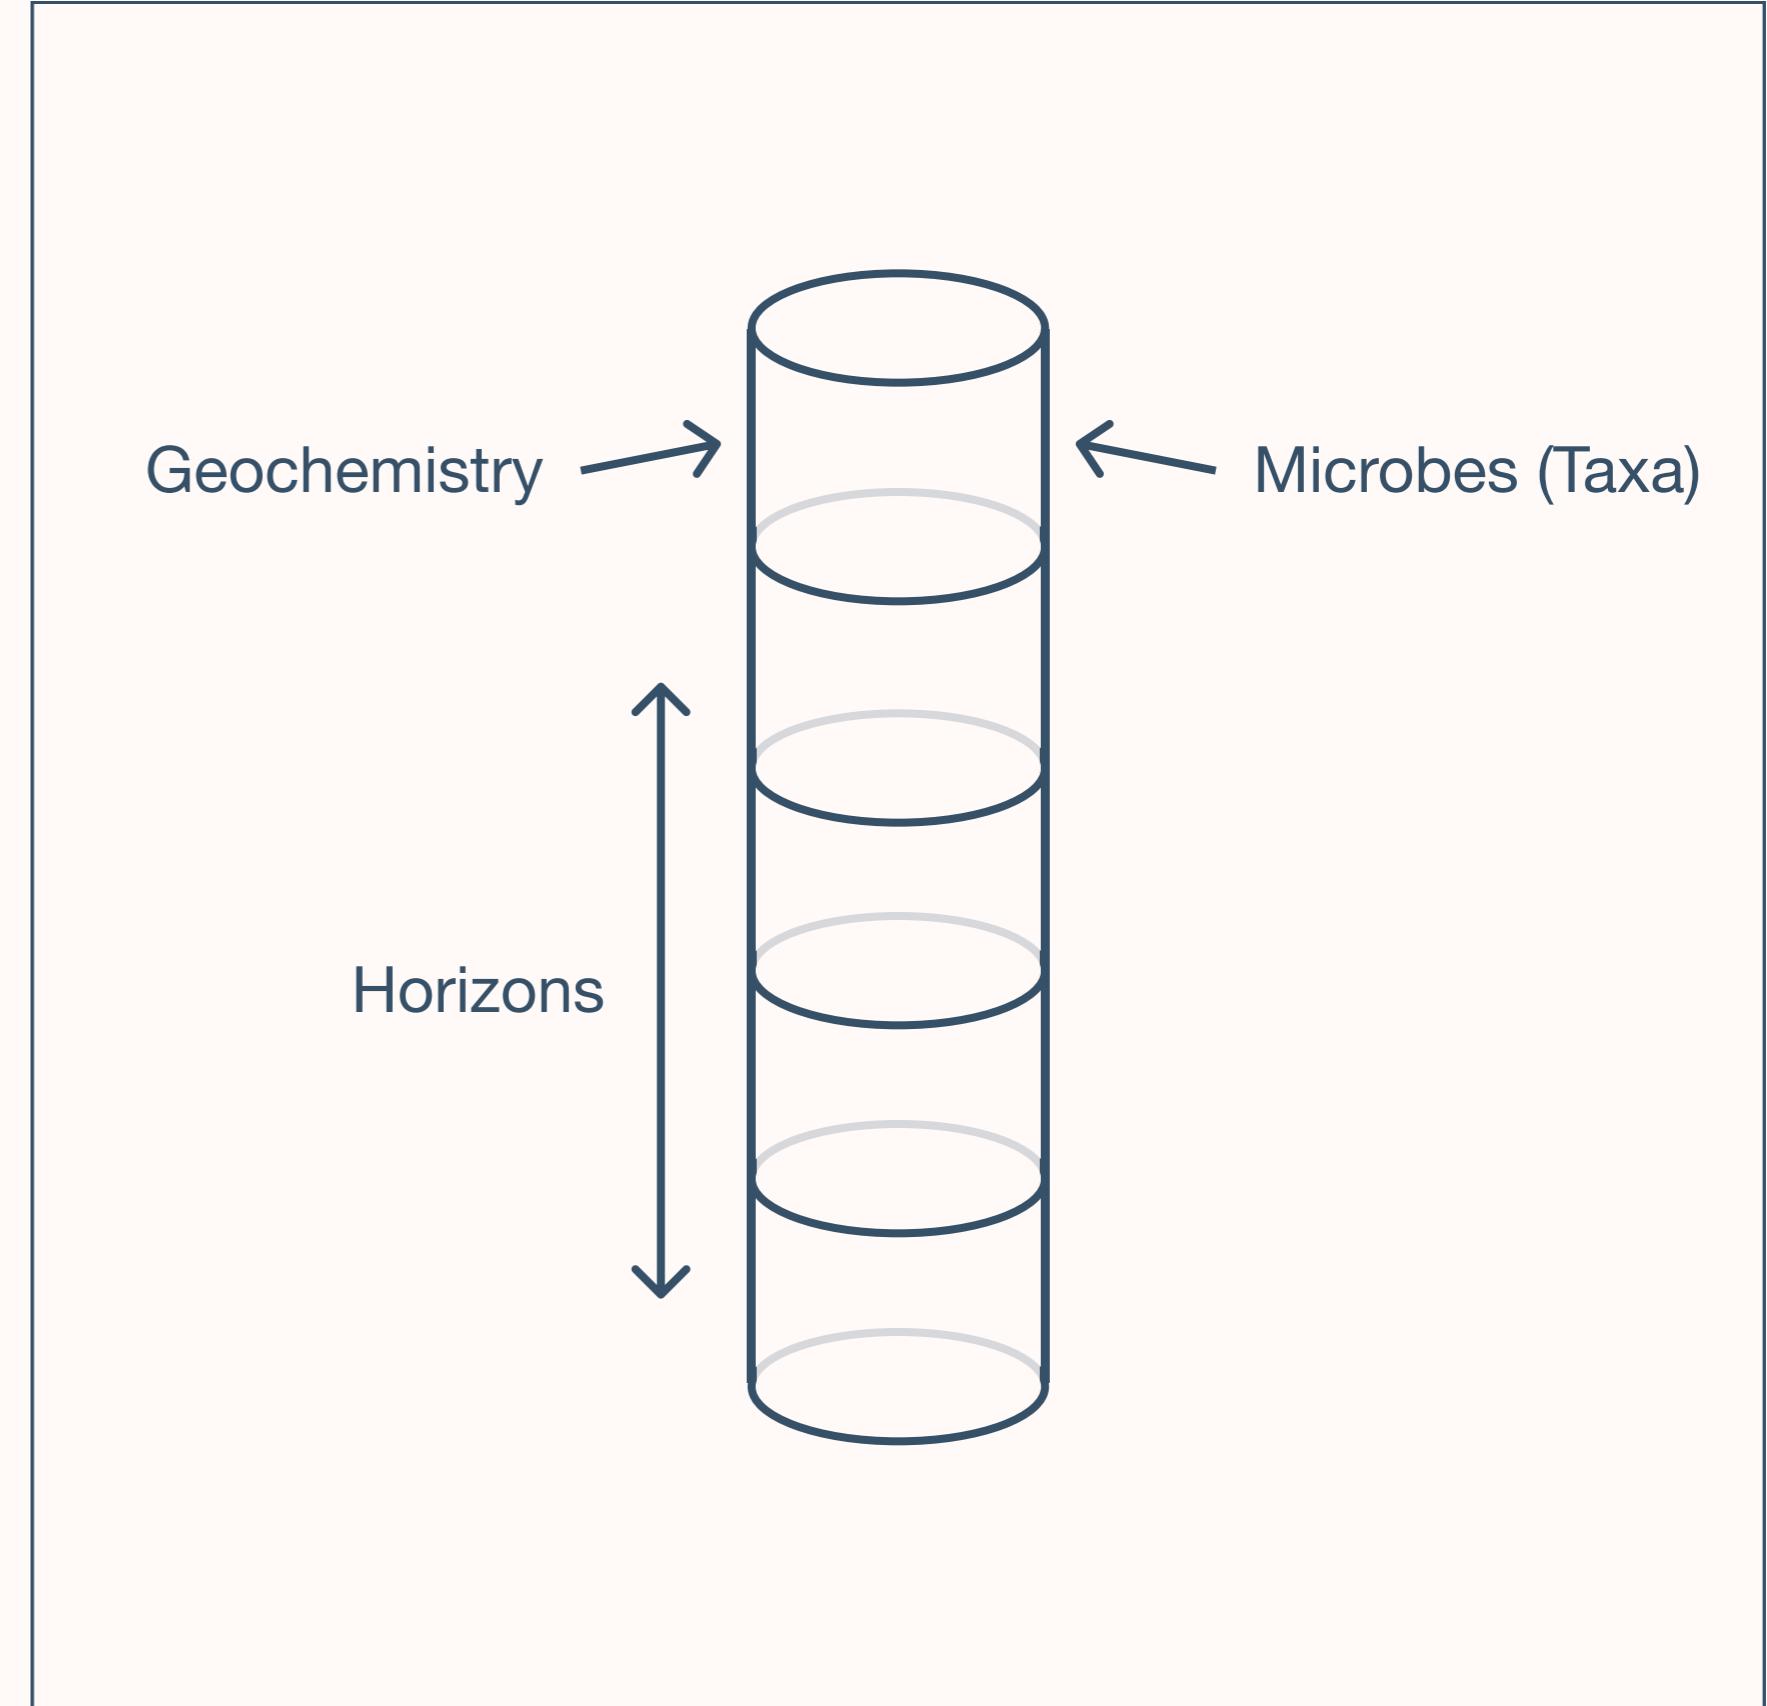

This process is expensive and time consuming, and so only a very limited number of samples can be taken.

Pre-Dive Mapping Data

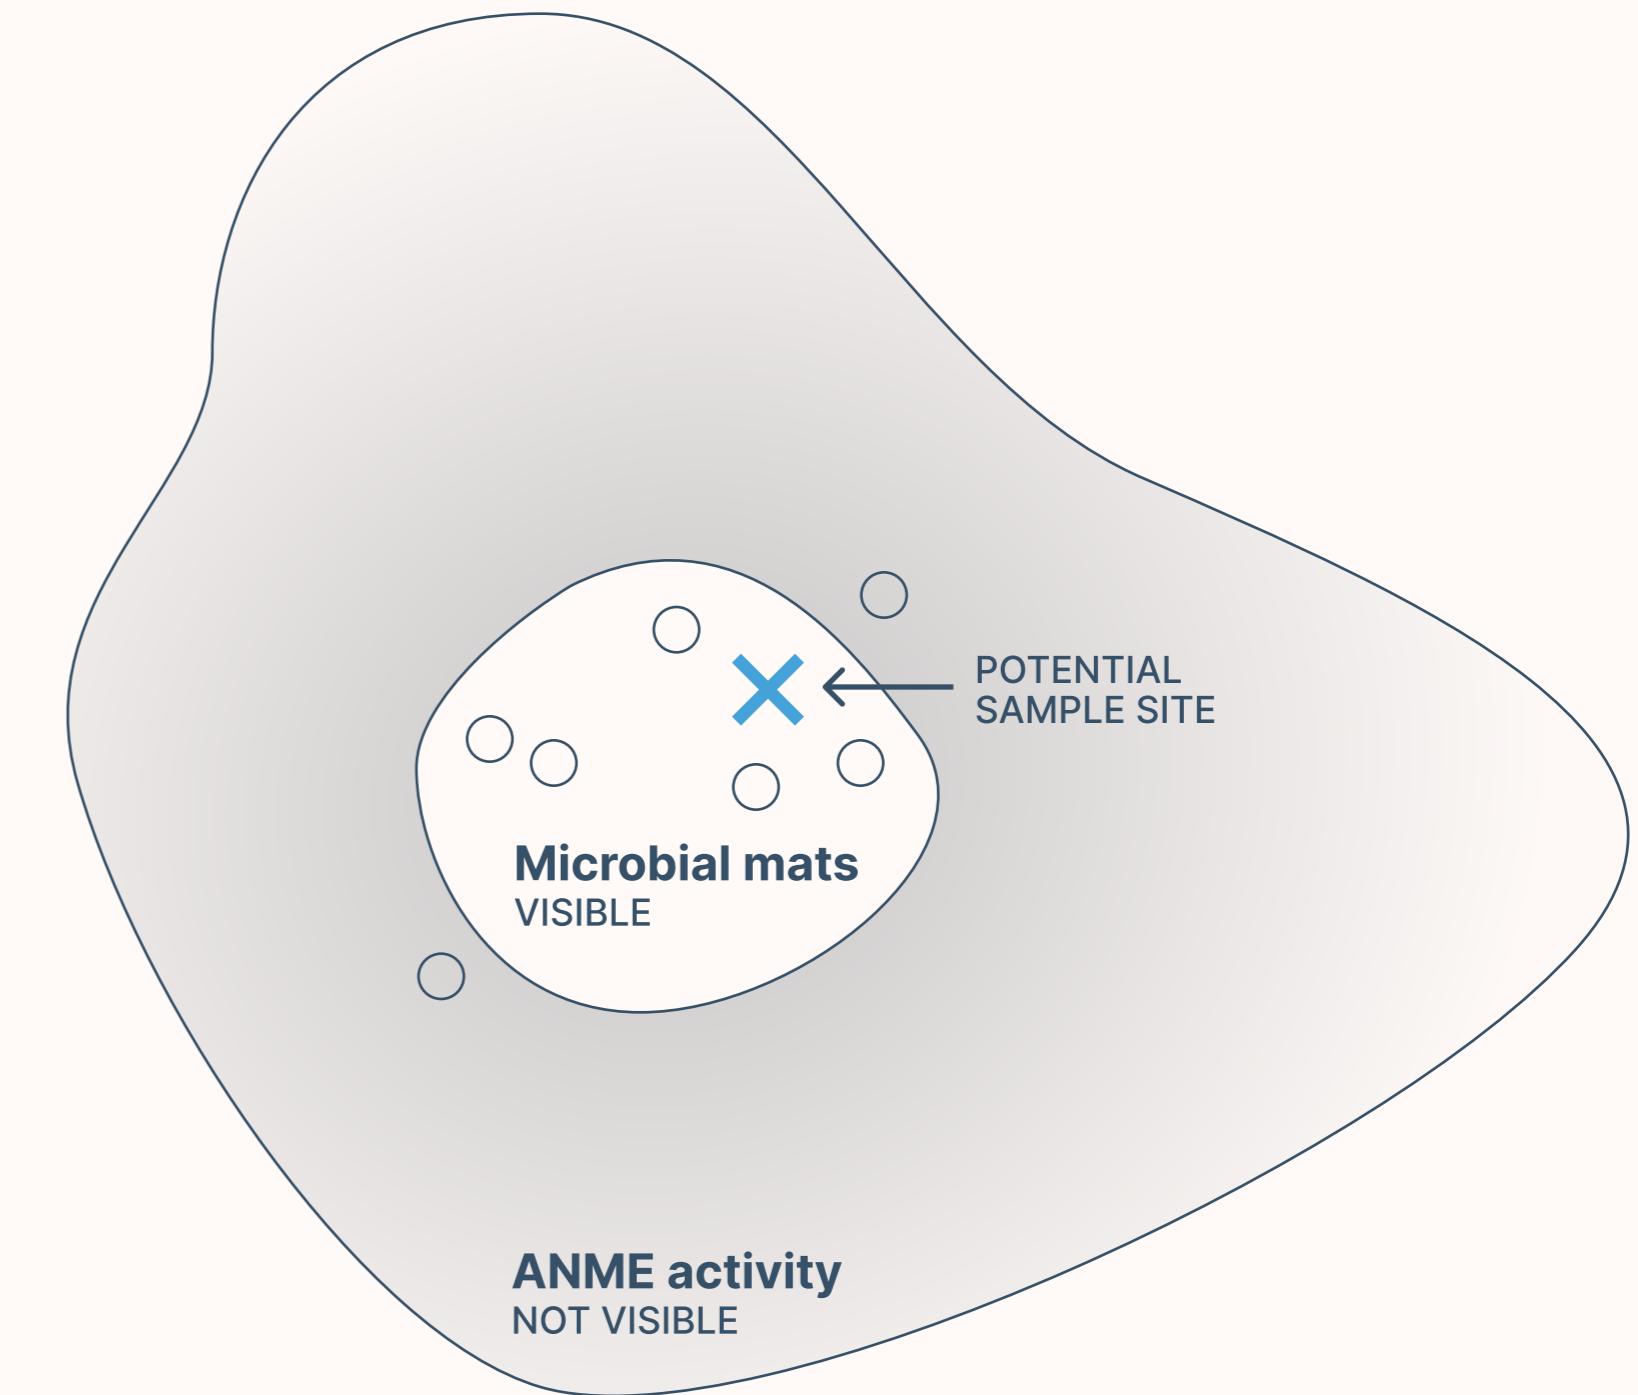

Core Sample Data

The Context

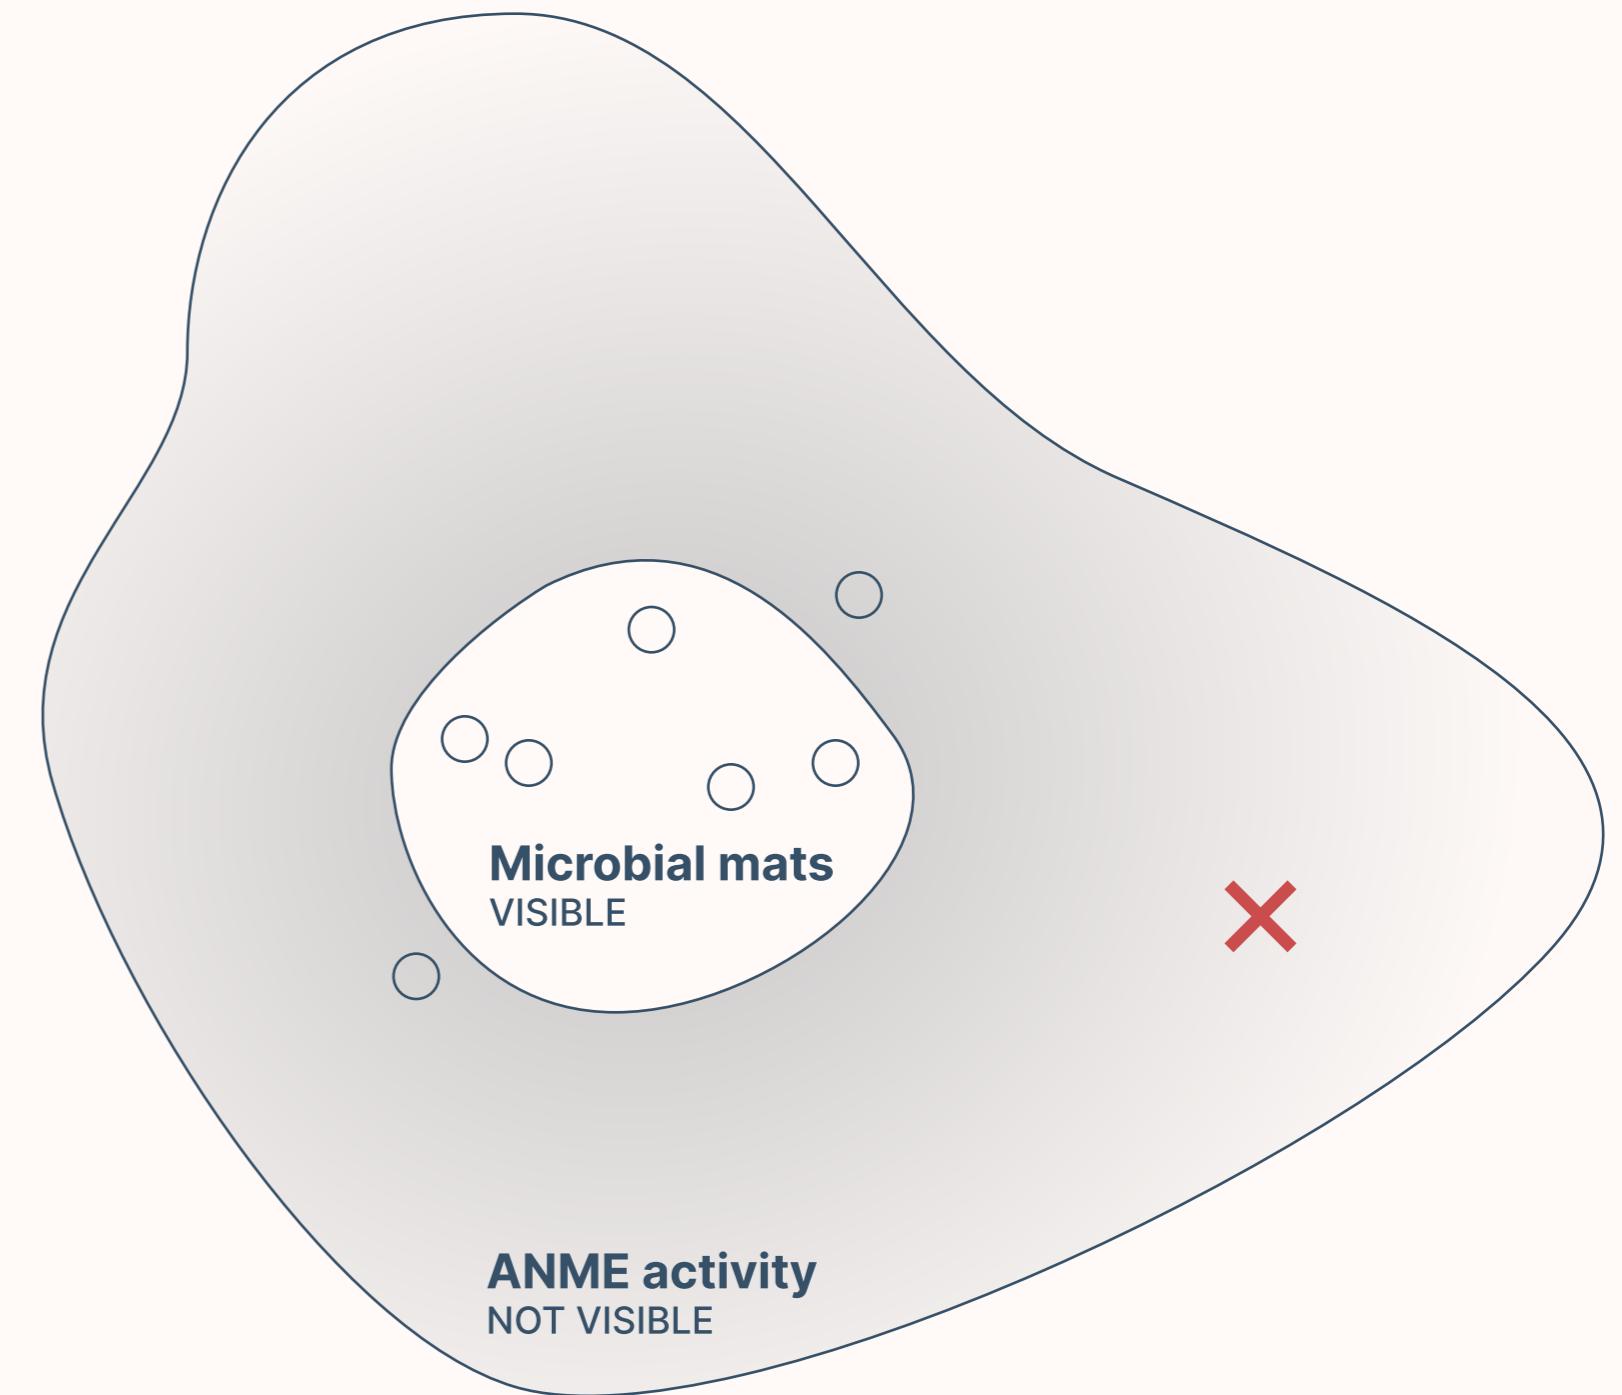

The cost associated with taking samples creates strong incentives to pick “obvious spots” where there is visible surface expression of microbial communities.

Samples that are taken outside surface expression are less likely to have scientific value.

The Challenge

However, this approach limits scientists' ability to understand the true bounds of where these important microbes live and how this changes over time.

Our Task

Help scientists make more informed sample site selections in non-obvious locations to illuminate the “edges” of microbial activity around methane seeps.

Our Process

**Contextual
Inquiry**

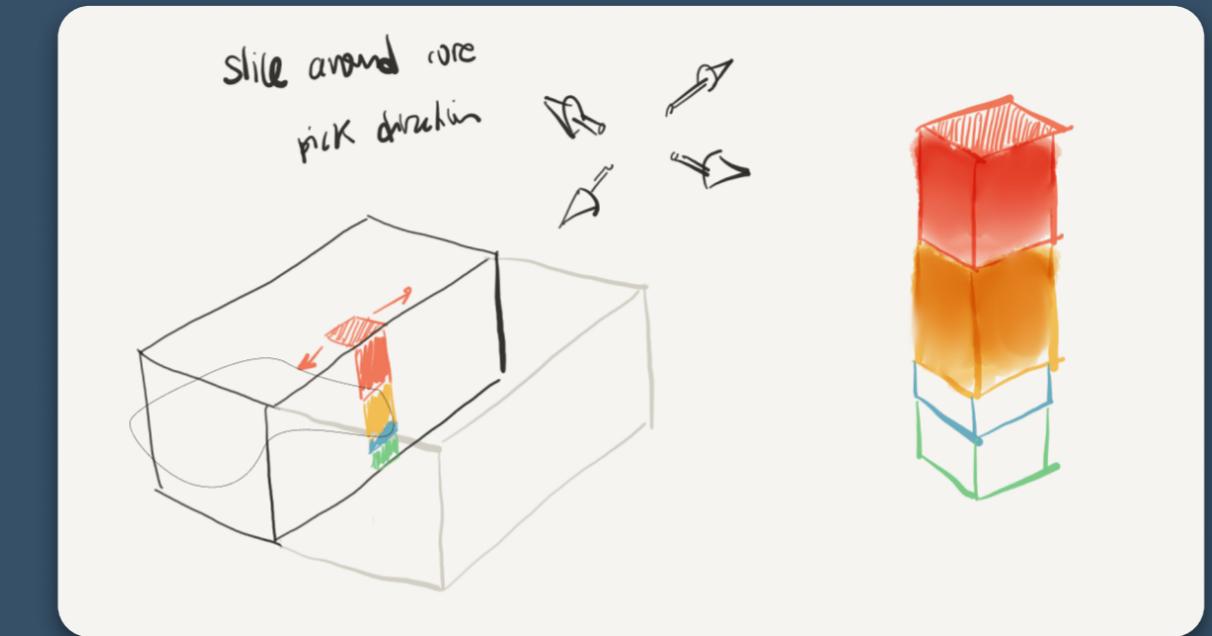

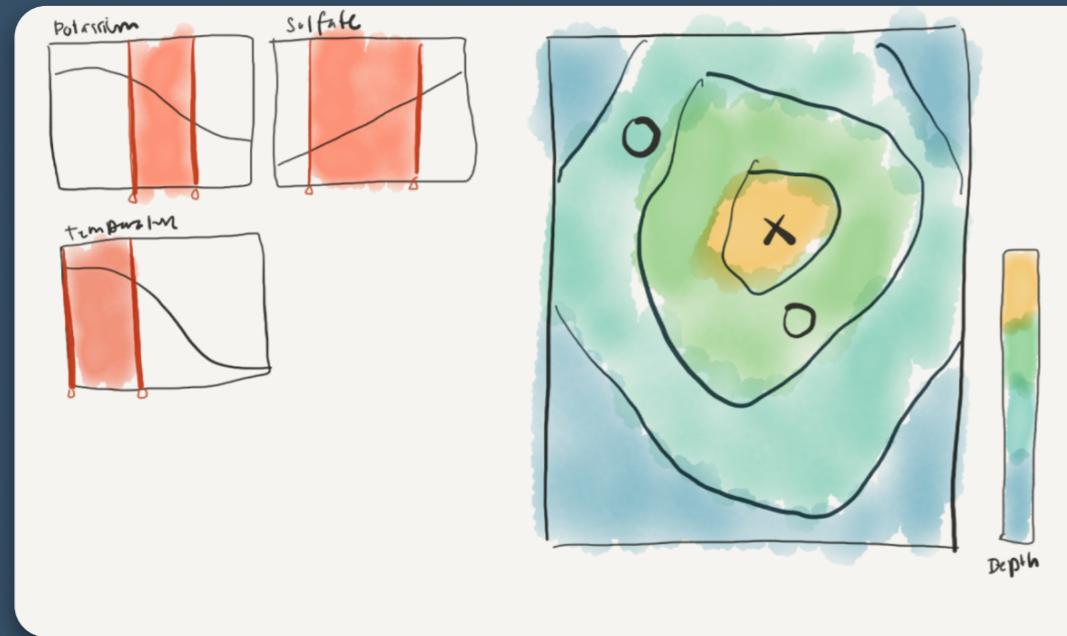

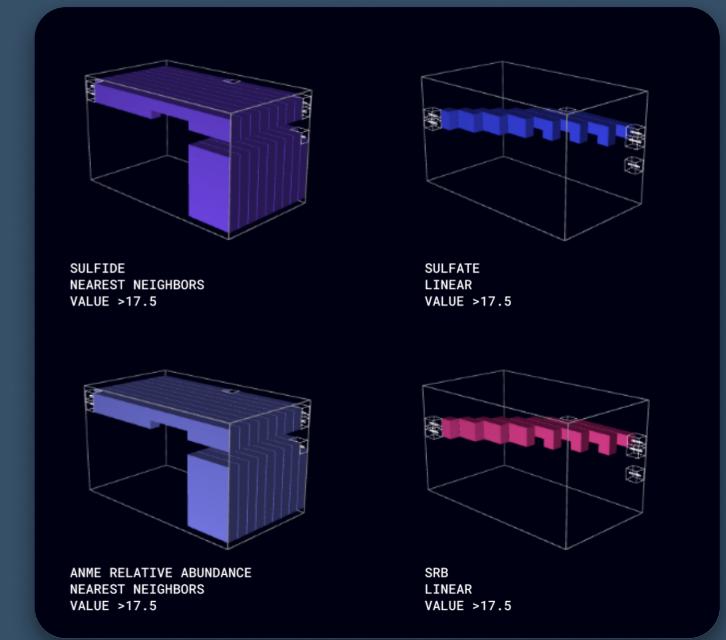

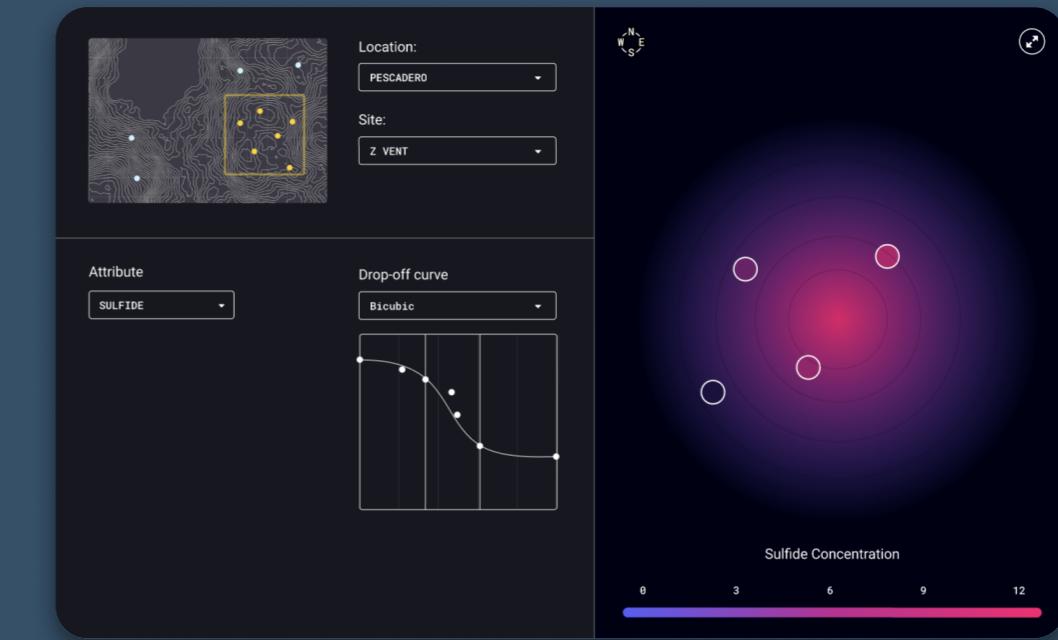

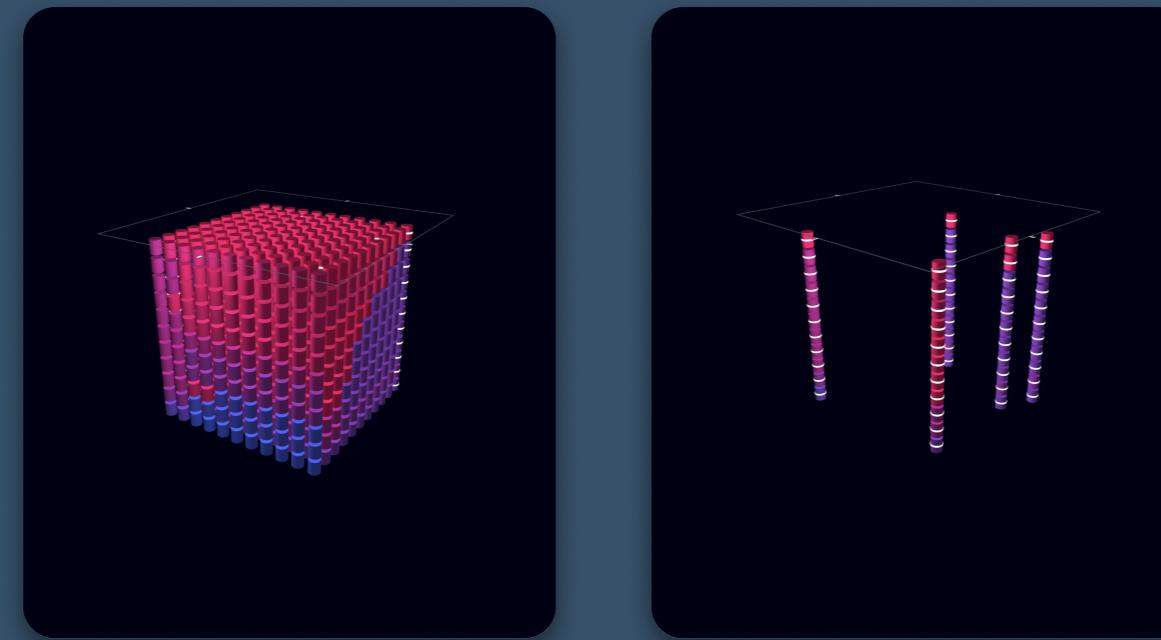

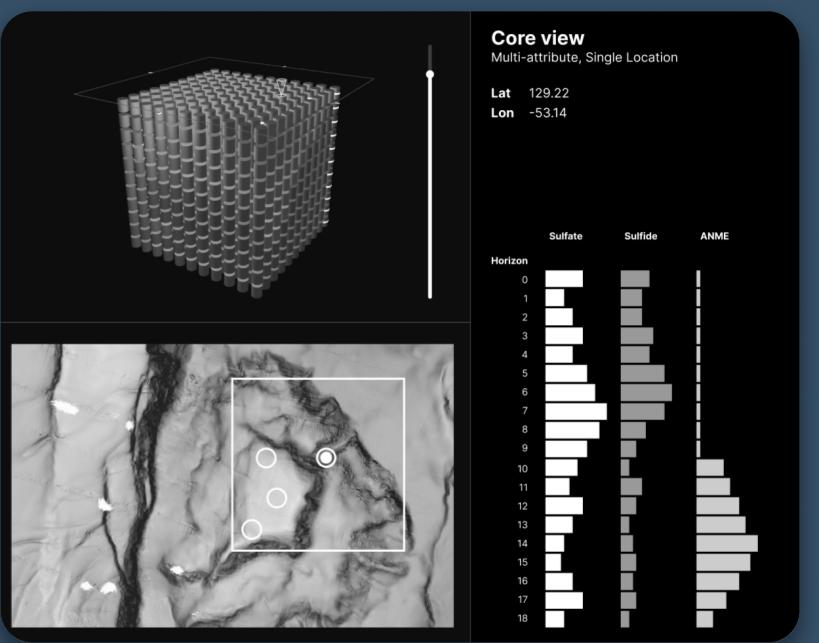

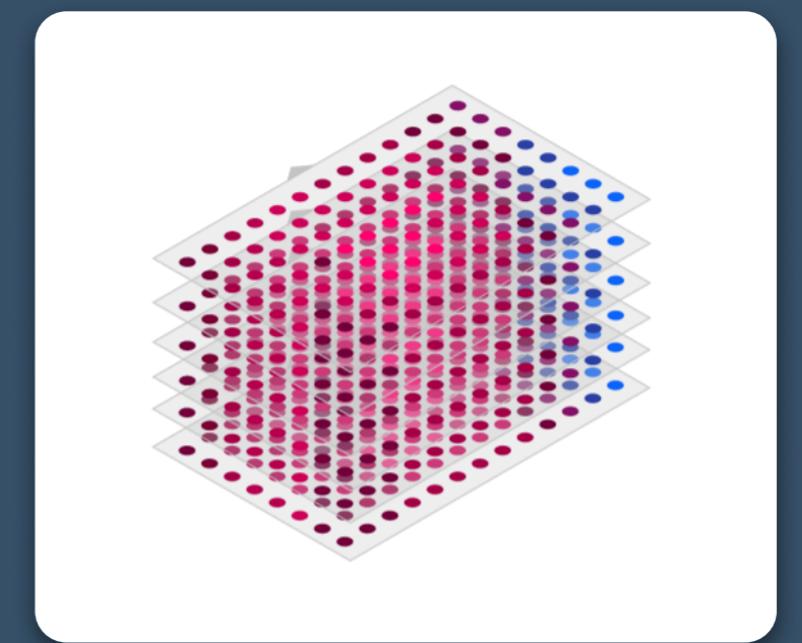

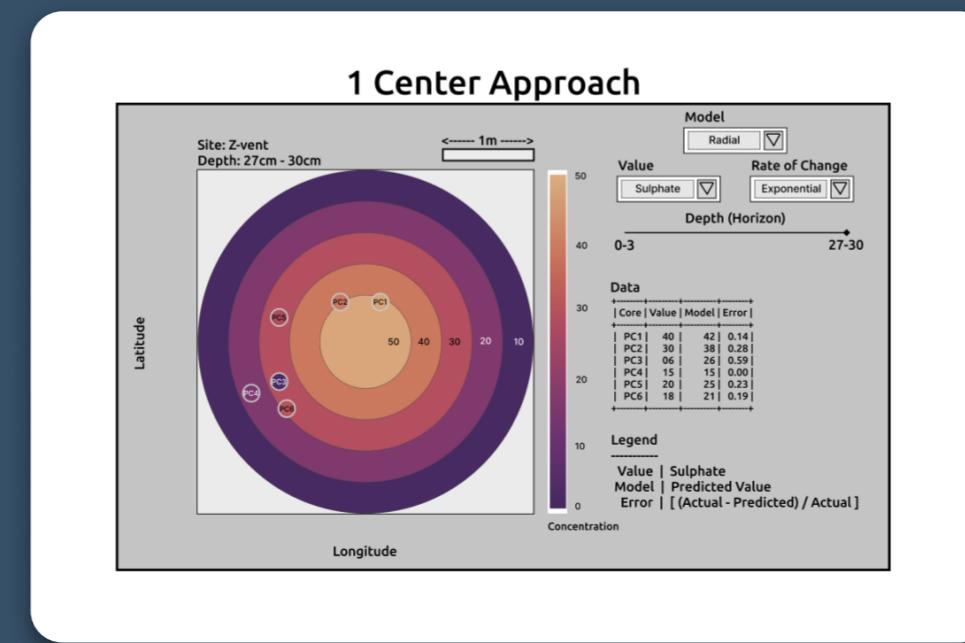

**Design & Data
Exploration**

**Today's
Prototype!**

**User Testing
& Refinement**

Alternative Explorations

Our Solution

DeepSee provides a platform to generate and visually explore 3D interpolations between sparse core data to guide future sample site selection.

Our Solution

DeepSee provides a platform to generate and visually explore 3D interpolations between sparse core data to guide future sample site selection.

Interpolating between known samples to fill in gaps in data and identify previously invisible hotspots of activity.

Our Solution

DeepSee provides a platform to generate and **visually explore** 3D interpolations between sparse core data to guide future sample site selection.

Allow scientists to visually explore interpolated data in 3 dimensions, building spacial intuition about distributions.

Our Solution

DeepSee provides a platform to generate and visually explore 3D interpolations between sparse core data to guide future sample site selection.

Provide all the necessary contextual information to inform site selection, including bathymetry and photomosaic maps.

Use Cases

1

Pre-cruise planning

Identify promising sample sites in advance of an upcoming research cruise

2

On-site refinement

Interpolate on the fly with data collected before a dive occurs (i.e. temperature)

1

Backend server

Python

A Python Flask web app is running in the background, receiving the CSV data from the frontend and creating datasets of XYZ data to be plotted by Three.js in the frontend.

2

Frontend interface

*Vue.js
+ Vuetify
+ Electron*

Vue.js serves static assets (PNG, CSV, JSON) and provides UI interactions styled with the Vuetify Material Design Framework, all wrapped into a standalone Electron desktop app.

3

Visualization

*D3.js
+ Three.js*

D3.js plots previously sampled cores on top of PNG images scaled by latitude and longitude. Three.js creates a traditional 3D render scene with lighting effects to show the distribution of interpolated values.

Avenues for Future Work

1 Integration with existing ecosystem of tools

Allow users to seamlessly analyze known cores in addition to interpolations.

2 Robust comparisons and annotations

Allow users to save maps, interpolations, annotations, and entire files in addition to cores.

3 Improved interpolation methods

Provide new ways to generate data, ranging from machine learning to nutrient flux modeling.

4 Inform autonomous space sampling missions

Leveraging the information humans use in selecting sample sites to help train autonomous sampling systems on other planets.

Next Steps

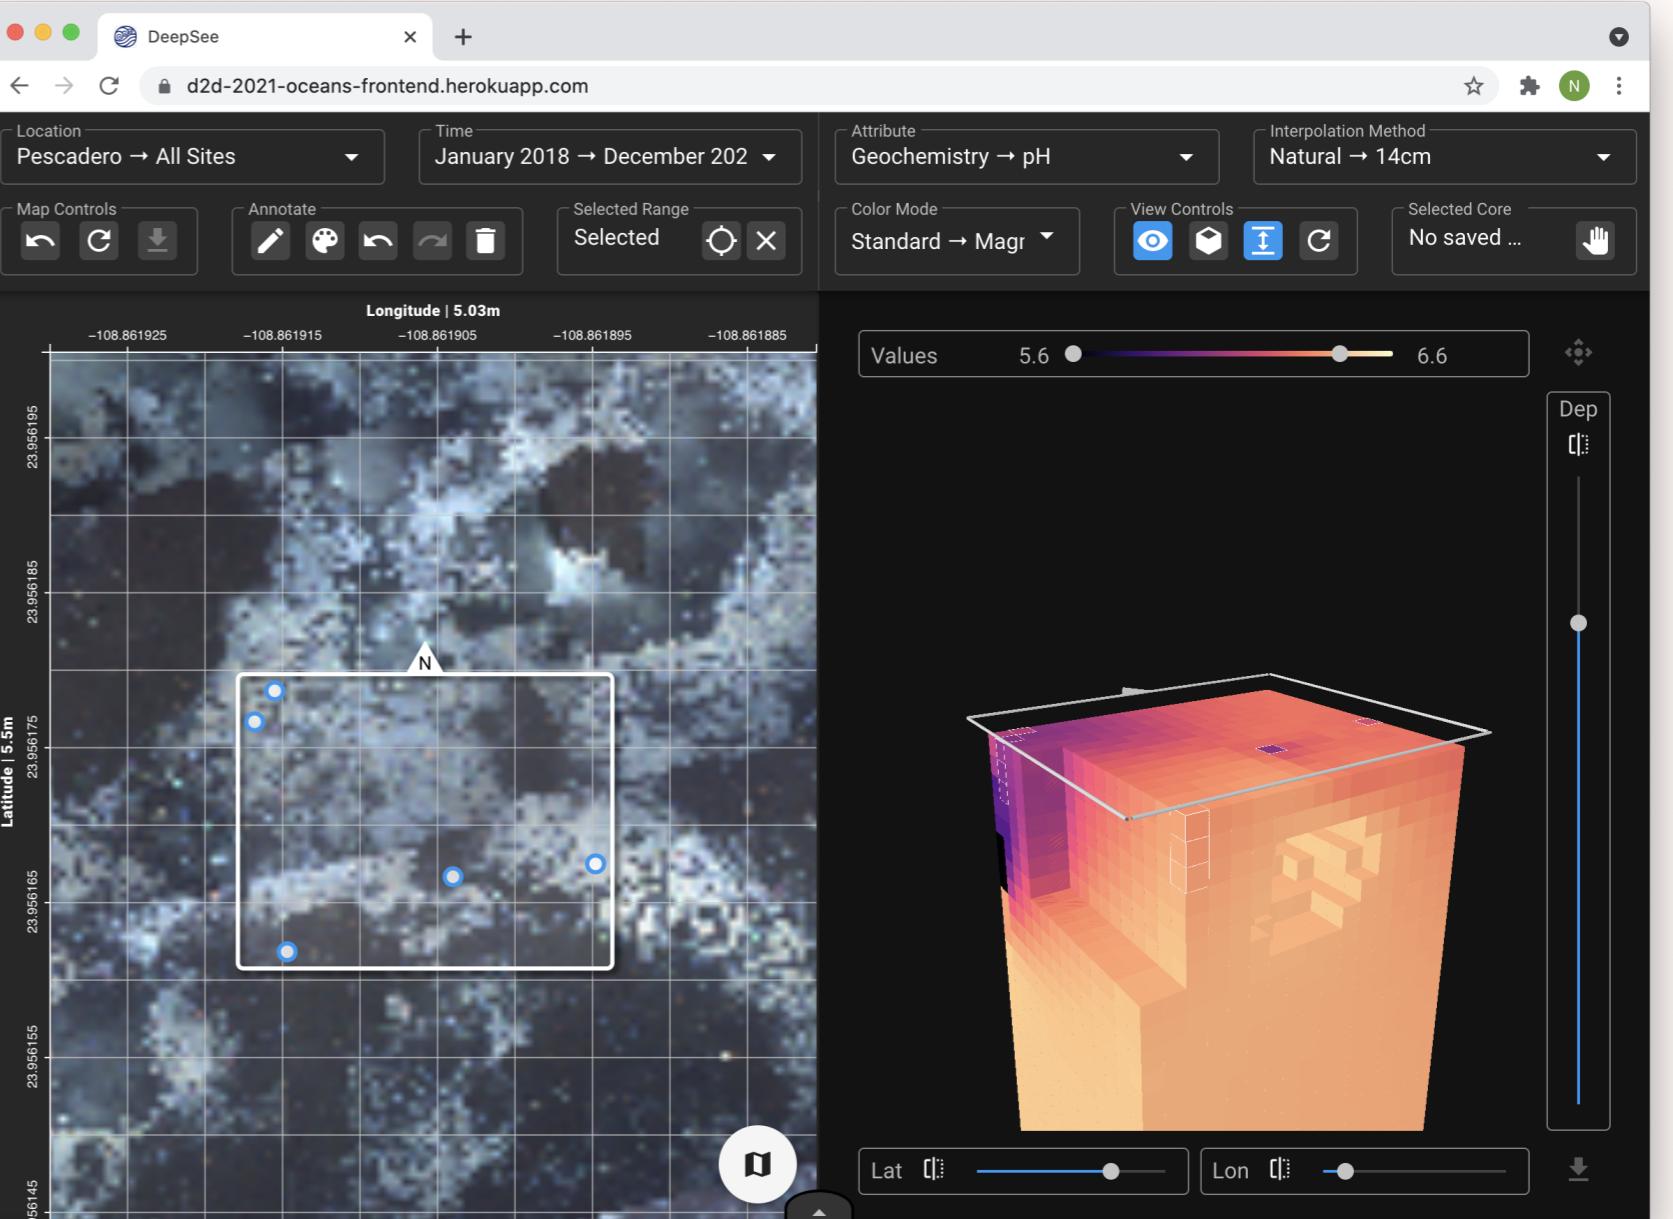

Test DeepSee on an
upcoming research cruise!

After

Acknowledgments

Thank you to **Haley, John, Victoria**, and the entire **Orphan Lab** team for their time and effort in collaborating on this project with us!

Thank you to our mentors **Hillary, Santiago, Maggie**, and **Scott** for their guidance and support throughout!
